

QuasarBrite Light-Activated Whitening Gel

QuasarBrite is a safe and effective light activated whitening system that lightens your teeth, almost immediately. Within only one hour, your teeth will be noticeably lighter and brighter. This makes QuasarBrite the ideal whitening procedure for patient's that may want to have a whiter, brighter smile but do not want to wait the 1 to 2 week necessary to complete a "take-home" whitening procedure.

QuasarBrite is a "state-of-art" bleaching system designed to be used with the latest technology available to your dentist. Specifically, the QuasarBrite Light Activated Whitening System is used with a dental laser, plasma arc light, or other high-intensity light source to accelerate the bleaching process and provide results only available through the professional care of your dentist.

Patients with mild tooth discoloration can experience optimal results often within one chairside application. Patients with more severe tooth staining can expect positive results using a combination of both the QuasarBrite chairside and contrastp.m. "take home" applications. Many patients will experience a delayed whitening effect. The hydrogen peroxide can continue to whiten well after the procedure is complete. The teeth may appear whiter the following day.
